

Vehicle Propulsion Systems

Lecture 8

Fuel Cell Vehicles

Lars Eriksson
Professor

Vehicular Systems
Linköping University

May 2, 2023

1/41

Outline

Repetition

Fuel Cell Electric Vehicles

- Fuel Cell Basics
- Fuel Cell Types
- Reformers
- Applications

Fuel Cell Modeling

Practical aspects

- Examples of Components in a Technology Demonstrator

2/41

Deterministic Dynamic Programming – Parallel Hybrid Example

- ▶ Fuel-optimal torque split factor $u(SOC, t) = \frac{T_{e-motor}}{T_{gearbox}}$
- ▶ ECE cycle
- ▶ Constraints $SOC(t = t_f) \geq 0.6$, $SOC \in [0.5, 0.7]$

Global optimum guaranteed within discretization.

Non-causal.

Full knowledge about the mission.

Curse of dimensionality $N_t N^{2d}$.

$d \in [1, 3]$

The [reference tool](#) used for development and comparisons.

Heuristic Control Approaches

- ▶ Parallel hybrid vehicle (electric assist)

- ▶ Determine control output as function of some selected state variables:
 vehicle speed, engine speed, state of charge, power demand, motor speed, temperature, vehicle acceleration, torque demand

On-Line Control – ECMS

- ▶ Given the optimal λ^* (cycle dependent exchange rate between fuel and electricity) .
- ▶ Hamiltonian

$$H(t, q(t), u(t), \lambda^*) = P_f(t, u(t)) + \lambda^* P_{ech}(t, u(t))$$

- ▶ Optimal control action

$$u^*(t) = \arg \min_u H(t, q(t), u, \lambda^*)$$

- ▶ Guess λ^* , run one cycle see end SOC, update λ^* , and iterate until $SOC(t_f) \approx SOC(0)$.

5/41

ECMS – Equivalent Consumption Minimization Strategy

- ▶ μ_0 depends on the (soft) constraint

$$\mu_0 = \frac{\partial}{\partial q(t_f)} \phi(q(t_f)) = \text{/special case/} = -w$$

- ▶ Different efficiencies

$$\mu_0 = \frac{\partial}{\partial q(t_f)} \phi(q(t_f)) = \begin{cases} -w_{dis}, & q(t_f) > q(0) \\ -w_{chg}, & q(t_f) < q(0) \end{cases}$$

- ▶ Introduce equivalence factor (scaling) by studying battery and fuel power

$$s(t) = -\mu(t) \frac{H_{LHV}}{V_b Q_{max}}$$

ECMS – Equivalent Consumption Minimization Strategy

6/41

Outline

Fuel Cell Electric Vehicles

- Fuel Cell Basics
- Fuel Cell Types
- Reformers
- Applications

Fuel Cell Modeling

Practical aspects

Examples of Components in a Technology Demonstrator

7/41

Introducing xEVs - From Victor Judez @ CEVT

8/41

Fuel Cell Basic Principles

- ▶ Convert fuel directly to electrical energy
- ▶ Let an ion pass from an anode to a cathode
- ▶ Take out electrical work from the electrons

9/41

Fuel Cell Stack

- ▶ The voltage out from one cell is just below 1 V.
- ▶ Fuel cells are stacked, in series.

10/41

Components in a Fuel Cell Stack

11/41

Overview of Different Fuel Cell Technologies

12/41

AFC – Alkaline Fuel cell

- ▶ Among the most efficient fuel cells 70%
- ▶ Low temperature 65-220°C
 - ▶ Quick start, fast dynamics
 - ▶ No co-generation
- ▶ Sensitive to poisoning

13/41

PEMFC – Proton Exchange Membrane Fuel Cell

Advantages:

- ▶ Relatively high power-density characteristic
- ▶ Operating temperature, less than 100°C
 - Allows rapid start-up
- ▶ Good transient response, i.e. change power
 - Top candidate for automotive applications**
- ▶ Other advantages relate to the electrolyte being a solid material, compared to a liquid

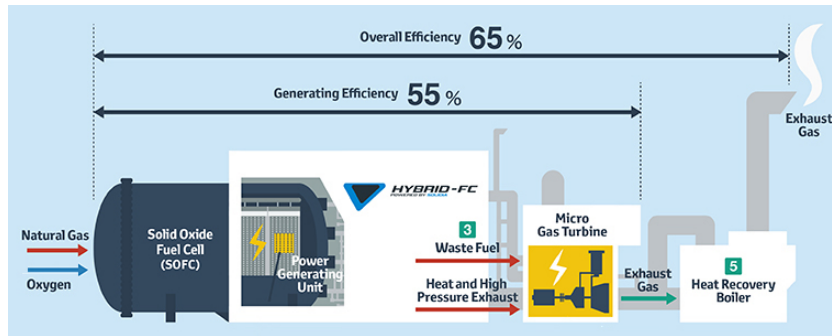

Disadvantages:

- ▶ Require expensive catalyst material (Platinum)
- ▶ For some applications operating temperature is low
- ▶ The electrolyte is required to be saturated with water to operate optimally.
 - Careful control of the moisture of the anode and cathode

14/41

The Other Types of H₂ Fuel Cells

- ▶ Other fuel cell types are
 - ▶ PAFC – Phosphoric Acid Fuel Cell 175°C
 - ▶ MCFC – Molten Carbonate Fuel Cell 650°C
 - ▶ SOFC – Solid Oxide Fuel Cells 1000°C
- ▶ Hotter cells, slower, more difficult to control
- ▶ Power generation through co-generation

15/41

Hydrogen Fuel Storage

- ▶ Hydrogen storage is a challenging task.
- ▶ Some examples of different options.
 - ▶ Compressed Hydrogen storage
 - ▶ Liquid phase – Cryogenic storage, -253°C
 - ▶ Metal hydride
 - ▶ Sodium borohydride $NaBH_4$

16/41

Comparison of H₂ Fuel Cells – US DOE

Fuel Cell Type	Common Electrolyte	Operating Temperature	Typical Stack Size	Efficiency	Applications	Advantages	Disadvantages
Polymer Electrolyte Membrane (PEM)	Perfluoro sulfonic acid	50-100°C 122-212° typically 80°C	< 1kW-100kW	60% transportation 35% stationary	<ul style="list-style-type: none"> Backup power Portable power Distributed generation Transportation Specialty vehicles 	<ul style="list-style-type: none"> Solid electrolyte reduces corrosion & electrolyte management problems Low temperature Quick start-up 	<ul style="list-style-type: none"> Expensive catalysts Sensitive to fuel impurities Low temperature waste heat
Alkaline (AFC)	Aqueous solution of potassium hydroxide soaked in a matrix	90-100°C 194-212°F	10-100 kW	60%	<ul style="list-style-type: none"> Military Space 	<ul style="list-style-type: none"> Cathode reaction faster in alkaline electrolyte, leads to high performance Low cost components 	<ul style="list-style-type: none"> Sensitive to CO₂ in fuel and air Electrolyte management
Phosphoric Acid (PAFC)	Phosphoric acid soaked in a matrix	150-200°C 302-392°F	400 kW 100 kW module	40%	<ul style="list-style-type: none"> Distributed generation 	<ul style="list-style-type: none"> Higher temperature enables CHP Increased tolerance to fuel impurities 	<ul style="list-style-type: none"> Pt catalyst Long start up time Low current and power
Molten Carbonate (MCFC)	Solution of lithium, sodium, and/or potassium carbonates, soaked in a matrix	600-700°C 1112-1292°F	300 kW-3 MW 300 kW module	45-50%	<ul style="list-style-type: none"> Electric utility Distributed generation 	<ul style="list-style-type: none"> High efficiency Fuel flexibility Can use a variety of catalysts Suitable for CHP 	<ul style="list-style-type: none"> High temperature corrosion and breakdown of cell components Long start up time Low power density
Solid Oxide (SOFC)	Yttria stabilized zirconia	700-1000°C 1202-1832°F	1 kW-2 MW	60%	<ul style="list-style-type: none"> Auxiliary power Electric utility Distributed generation 	<ul style="list-style-type: none"> High efficiency Fuel flexibility Can use a variety of catalysts Solid electrolyte Suitable for CHP & CHHP Hybrid/GT cycle 	<ul style="list-style-type: none"> High temperature corrosion and breakdown of cell components High temperature operation requires long start up time and limits

17/41

DMFC – Direct Methanol Fuel Cell

- ▶ Basic operation
 - ▶ Anode Reaction: $CH_3OH + H_2O \Rightarrow CO_2 + 6H^+ + 6e^-$
 - ▶ Cathode Reaction: $3/2O_2 + 6H^+ + 6e^- \Rightarrow 3H_2O$
 - ▶ Overall Cell Reaction: $CH_3OH + 3/2O_2 \Rightarrow CO_2 + 2H_2O$
- ▶ Main advantage, does not need pure Hydrogen.
- ▶ Applications outside automotive
 - battery replacements
 - small light weight
- ▶ Low temperature
- ▶ Methanol toxicity is a problem

18/41

Reformers

- ▶ Fuel cells need hydrogen – Generate it on-board
- Steam reforming of methanol.

Fuel Cell Applications in USA – US DOE

<p>Fuel Cells for Stationary Power, Auxiliary Power, and Specialty Vehicles</p> <p>The largest markets for fuel cells today are in stationary power, portable power, auxiliary power units, and forklifts.</p> <p>~75,000 fuel cells have been shipped worldwide.</p> <p>>15,000 fuel cells shipped in 2009</p> <p>Fuel cells can be a cost-competitive option for critical-load facilities, backup power, and forklifts.</p> 	<p>Fuel Cells for Transportation</p> <p>In the U.S., there are currently:</p> <ul style="list-style-type: none"> > 200 fuel cell vehicles ~ 20 active fuel cell buses ~ 60 fueling stations <p>Sept. 2009: Auto manufacturers from around the world signed a letter of understanding supporting fuel cell vehicles in anticipation of widespread commercialization, beginning in 2015.</p> 
<p>Production & Delivery of Hydrogen</p> <p>In the U.S., there are currently:</p> <ul style="list-style-type: none"> ~9 million metric tons of H₂ produced annually > 1200 miles of H₂ pipelines <p>Source: US DOE 09/2010</p> 	

Outline

Repetition

Fuel Cell Electric Vehicles

- Fuel Cell Basics
- Fuel Cell Types
- Reformers
- Applications

Fuel Cell Modeling

Practical aspects

Examples of Components in a Technology Demonstrator

21/41

Quasistatic Modeling of a Fuel Cell

► Causality diagram

- Power amplifier (Current controller)
- Fuel amplifier (Fuel controller)
- Standard modeling approach
- Keys for understanding:
 - Cell – The **polarization curve**
 - Operation – The Surrounding **System**

22/41

Fuel Cell Thermodynamics

- ▶ Starting point reaction equation

- ▶ Open system energy – Enthalpy H

$$H = U + pV$$

- ▶ Available (reversible) energy – Gibbs free energy G

$$G = H - TS$$

- ▶ Open circuit cell voltages

$$U_{rev} = -\frac{\Delta G}{n_e F}, \quad U_{id} = -\frac{\Delta H}{n_e F}, \quad U_{rev} = \eta_{id} U_{id}$$

F – Faradays constant ($F = q N_0$)

- ▶ Heat losses under load $P_l = I_{fc}(t) (U_{id} - U_{fc}(t)) \Rightarrow$ **Cooling system**

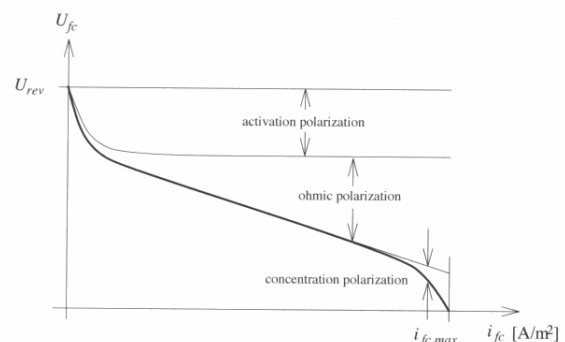

23 / 41

Fuel Cell Performance – Polarization curve

- ▶ Polarization curve of a fuel cell

Relating current density $i_{fc}(t) = I_{fc}(t)/A_{fc}$, and cell voltage $U_{fc}(t)$ Curve for one operating condition

- ▶ Fundamentally different compared to combustion engine/electrical motor
- ▶ Excellent part load behavior
 - When considering only the cell
 - η_{cell} follows the Voltage

24 / 41

Single Cell Modeling – Describing the Polarization Curve

Fuel cell voltage

$$U_{fc}(t) = U_{rev}(t) - U_{act}(t) - U_{ohm}(t) - U_{conc}(t)$$

- ▶ Activation energy – Get the reactions going
Semi-empirical Tafel equation

$$U_{act}(t) = c_0 + c_1 \ln(i_{fc}(t)), \text{ or } U_{act}(t) = \dots$$

- ▶ Ohmic – Resistance to flow of ions in the cell

$$U_{ohm}(t) = i_{fc}(t) \tilde{R}_{fc}$$

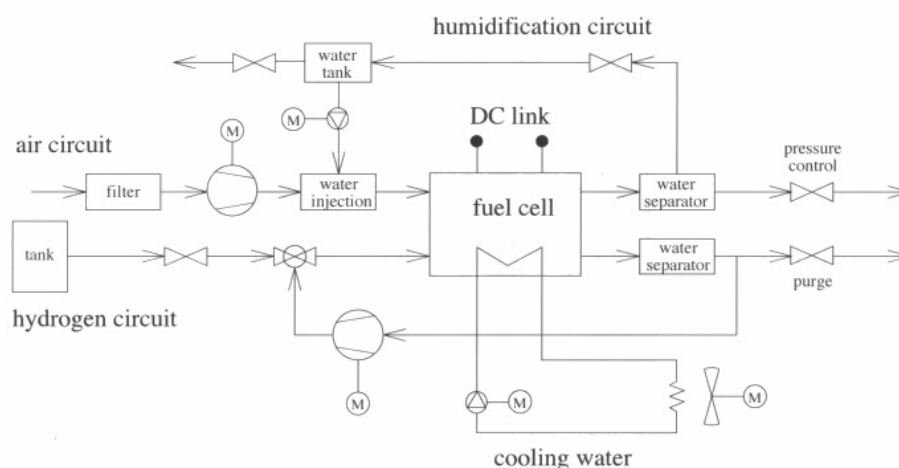

- ▶ Concentration, change in concentration of the reactants at the electrodes

$$U_{conc}(t) = c_2 \cdot i_{fc}(t)^{c_3}, \text{ or } U_{conc}(t) = \dots$$

25/41

Fuel Cell System Modeling

- ▶ A complete fuel cell system

- ▶ Power at the stack with N cells

$$P_{st}(t) = I_{fc}(t) U_{fc}(t) N$$

26/41

Important effects for the cell and system

Cell Pressure

Cell excess air λ

Boosting the performance

27/41

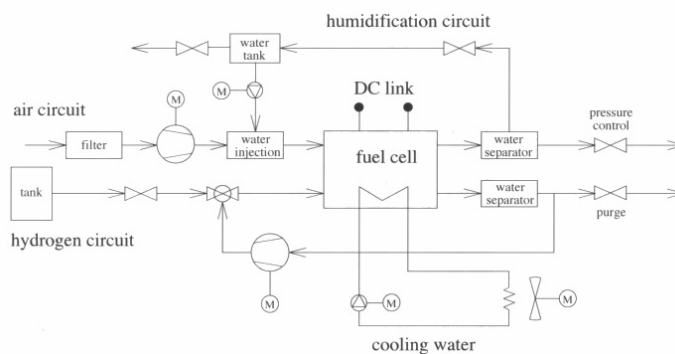

Fuel Cell System Modeling

- Describe all subsystems with models

$$P_2(t) = P_{st}(t) - P_{aux}(t)$$

$$P_{aux} = P_0 + P_{em}(t) + P_{ahp}(t) + P_{hp}(t) + P_{cl}(t) + P_{cf}(t)$$

em – electric motor, ahp – humidifier pump, hp – hydrogen recirculation pump, cl – coolant pump, cf – cooling fan.

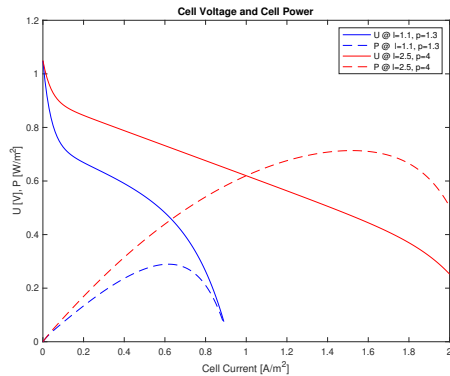

- Submodels for:
Hydrogen circuit, air circuit, water circuit, and coolant circuit

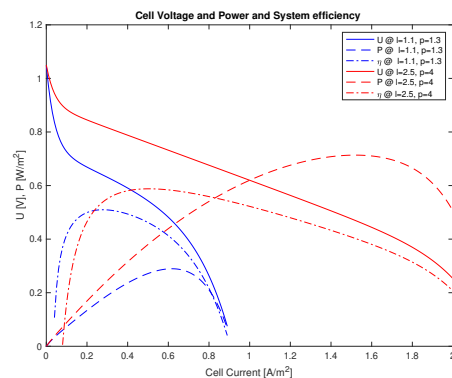

28/41

Fuel Cell System Performance at Low and High P_c

Individual Cell

Fuel Cell System

- Efficiency is highest at part loads towards low load.
- The system is stealing current to keep the cell operating.

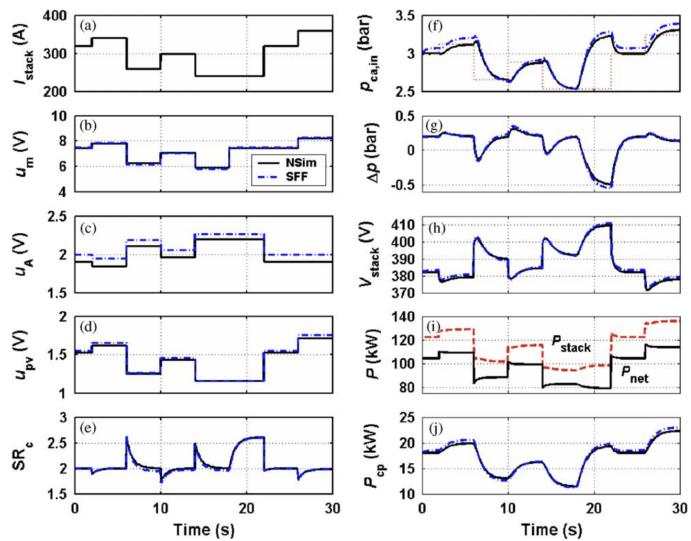

29 / 41

Fuel Cell System Dynamics

Open Loop Steps on Inputs

Note

- ▶ λ , bottom left
- ▶ Pressure, top right
- ▶ Gap in Cell & Output Power
- ▶ Due to compressor power

The system has non-negligible dynamics.

32 / 41

Fuel Cell HEV – Short Term Storage

Short term storage

1. Recuperation, regenerative braking
2. FC system has non-negligible time constants
3. Super capacitors
4. Batteries
5. Hybridization

33 / 41

Fuel Cell Vehicle

The Hy.Power vehicle, going over a mountain pass in Switzerland in 2002.

- ▶ Technology demonstrator
- ▶ Lower oxygen contents, 2005 m
- ▶ Cold weather

Let us look at the real components in the powertrain under the shell.

34 / 41

Components – Electric Motor

35/41

Components – Fuel Supply and Fuel Cell Stack

36/41

Components – Fuel Cell Stack, Heat Exchanger & Controller

37/41

Components – Fuel Cell Stack, Controller and Heat exchanger

38/41

Components – Power Electronics and Super Caps

39 / 41

Lecture is a preparation for the future

Non trivial system that is about to boom in China...

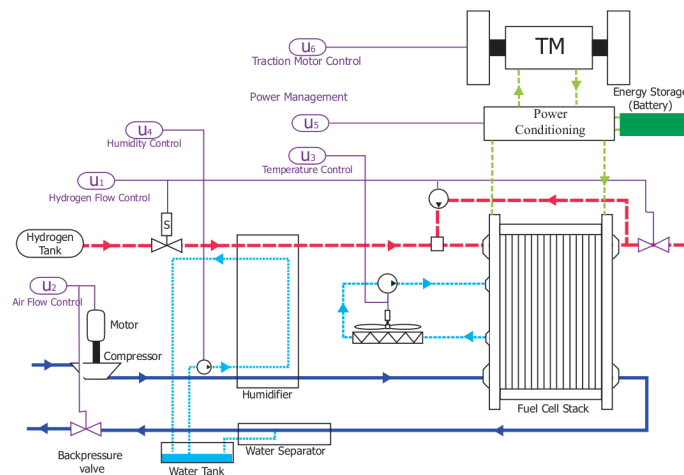

Illustration provided by Prof. Anna Stefanopoulou, University of Michigan.
